Register Patient Arrival

Field	Answer
ID:	UC2
Title:	Register Patient Arrival
Description:	This use case describes how administration staff registers a patient's arrival for a scheduled appointment. The system identifies the appointment, verifies its eligibility for check-in, and updates the patient's arrival status.
Primary Actor:	Administrative Staff
Preconditions:	- The Appointment Tracking System is operational - Administrative staff is authenticated and authorized to register arrivals
Postconditions:	- The selected appointment's arrival status is updated to Arrived - The patient's arrival time is recorded - An activity record documenting the patient's check-in is created and stored
Inputs:	1. Patient identifier or search information 2. Appointment identifier 3. Arrival confirmation
Outputs:	1. Patient and appointment information 2. Confirmation of successful arrival registration 3. Error message if registration fails
Main Success Scenario:	1. Administrative Staff selects the option to register a patient's arrival 2. System prompts for patient identification 3. Administrative Staff enters search information (insurance number, date of birth, phone number, name) 4. System displays matching patients and their appointments scheduled for the current day 5. Administrative Staff selects the relevant appointment 6. System verifies the appointment is confirmed, scheduled for the current day, and not already marked as arrived. 7. Administrative Staff confirms the patient's arrival 8. System updates the arrival status to Arrived and records the arrival time 9. System creates an activity record for the check-in 10. System displays a confirmation message
Failure Scenario: No Matching Appointment	1. At step 4 of the main success scenario, the system finds no appointment for the specified patient on the current day 2. System displays a message indicating that no appointment was found 3. No appointment information is modified 4. Administrative Staff may retry the search or end the use case
