Request Appointment

Field	Answer
ID:	UC1
Title:	Request Appointment
Description:	This use case describes how a patient requests an appointment with a healthcare professional. The system checks slot availability, validates a referral when required, and either confirms the appointment or returns a reason for rejection.
Primary Actor:	Patient
Preconditions:	- The Appointment Tracking System is operational - The patient and healthcare professional are registered in the system - The requested service type is offered by the clinic
Postconditions:	- A new appointment is created and associated with the patient and healthcare professional - The appointment service, date, and time are recorded - The appointment status is set to Confirmed
Inputs:	1. Patient identifier 2. Healthcare professional identifier 3. Service type 4. Requested date and time 5. Referral information, if required
Outputs:	1. Appointment identifier and confirmation 2. Reason for rejection if the request fails
Main Success Scenario:	1. Patient selects the option to request an appointment 2. System prompts for the healthcare professional, service type, and preferred date and time 3. Patient enters the requested appointment information 4. System verifies that the patient and healthcare professional are registered and the service is offered 5. System checks whether the requested slot is available 6. System determines whether the service requires a referral 7. If required, System validates the patient's referral 8. System creates the appointment and associates it with the Patient and HealthcareProfessional 9. System records the service, date, and time and sets the status to Confirmed 10. System displays the appointment identifier and confirmation
Failure Scenario: Appointment Rejected	1. At step 5 or 7 of the main success scenario, the requested slot is unavailable or the required referral is invalid 2. System displays a message indicating the reason for rejection 3. No appointment is created 4. Patient may revise the request, retry, or end the use case
